

Package ‘aion’

December 10, 2024

Title Archaeological Time Series

Version 1.3.0

Description A toolkit for archaeological time series and time intervals.

This package provides a system of classes and methods to represent and work with archaeological time series and time intervals. Dates are represented as ``rata die'' and can be converted to (virtually) any calendar defined by Reingold and Dershowitz (2018) <[doi:10.1017/9781107415058](https://doi.org/10.1017/9781107415058)>. This packages offers a simple API that can be used by other specialized packages.

Description

Operators performing arithmetic operations.

Usage

```
## S4 method for signature 'RataDie,RataDie'  
Arith(e1, e2)  
  
## S4 method for signature 'numeric,RataDie'  
Arith(e1, e2)  
  
## S4 method for signature 'RataDie,numeric'  
Arith(e1, e2)
```

Arguments

e1, e2 A [RataDie](#) object or a [numeric](#) vector.

Details

Rata die will be converted to a plain [numeric](#) vector if a computation no longer makes sense in temporal terms.

Value

A [logical](#) vector.

Author(s)

N. Frerebeau

See Also

Other fixed date tools: [as_date\(\)](#), [as_decimal\(\)](#), [as_fixed\(\)](#), [as_year\(\)](#), [fixed\(\)](#), [fixed_gregorian\(\)](#), [fixed_julian\(\)](#), [format\(\)](#), [pretty\(\)](#)

Examples

```
## Vectors of years  
x <- fixed(c(-350, 31, 1072, 576, 1130), calendar = CE())  
y <- fixed(c(1494, 1645, -869, 1440, 1851), calendar = CE())  
  
## Move forward in time  
x + y
```

```
## Move backward in time
x - y

## Not rata die anymore
x * y
```

as.data.frame*Coerce to a Data Frame***Description**

Coerce to a Data Frame

Usage

```
## S4 method for signature 'TimeSeries'
as.data.frame(x, ..., calendar = NULL)

## S4 method for signature 'TimeIntervals'
as.data.frame(x, ..., calendar = NULL)
```

Arguments

<code>x</code>	A <code>TimeSeries</code> or a <code>TimeIntervals</code> object.
<code>...</code>	Further parameters to be passed to <code>data.frame()</code> .
<code>calendar</code>	A <code>TimeScale</code> object specifying the target calendar (see <code>calendar()</code>). If <code>NULL</code> (the default), <i>rata die</i> are returned.

Value

A `data.frame`.

Methods (by class)

- `as.data.frame(TimeSeries)`: Returns a long `data.frame` with the following columns:

<code>time</code>	The (decimal) years at which the time series was sampled.
<code>series</code>	The name of the time series.
<code>variable</code>	The name of the variables.
<code>value</code>	The observed value.
- `as.data.frame(TimeIntervals)`: Returns a `data.frame` with the following columns:

<code>label</code>	The name of the intervals.
<code>start</code>	The start time of the intervals, in (decimal) years.
<code>end</code>	The end time of the intervals, in (decimal) years.

Author(s)

N. Frerebeau

See Also

Other mutators: [labels\(\)](#), [length\(\)](#), [subset\(\)](#)

Examples

```
## Create time-series of 20 observations

## Univariate
## Sampled every years starting from 1029 BCE
(X <- series(rnorm(30), time = 1029:1000, calendar = BCE()))

## Terminal and sampling times (returns rata die)
start(X)
end(X)
time(X)
span(X)

## Multivariate
## Sampled every century starting from 1000 CE
(Y <- series(matrix(rnorm(90), 30, 3), time = 1000:1029, calendar = CE()))

## Terminal and sampling times (returns Gregorian Common Era years)
start(Y, calendar = CE())
end(Y, calendar = CE())
time(Y, calendar = CE())
span(Y, calendar = CE())

## Coerce to data frame
df <- as.data.frame(Y, calendar = BP())
head(df)
```

as_date

Date Conversion from Rata Die

Description

Date Conversion from *Rata Die*

Usage

```
as_date(object, calendar)

## S4 method for signature 'numeric,GregorianCalendar'
as_date(object, calendar)

## S4 method for signature 'numeric,JulianCalendar'
as_date(object, calendar)
```

Arguments

- `object` A `RataDie` object (see [fixed\(\)](#)).
`calendar` A `TimeScale` object specifying the target calendar (see [calendar\(\)](#)).

Value

A `numeric` vector of (decimal) years.

Author(s)

N. Frerebeau

References

Other fixed date tools: `arithmetic`, `as_decimal()`, `as_fixed()`, `as_year()`, `fixed()`, `fixed_gregorian`, `fixed_julian`, `format()`, `pretty()`

Examples

```
## R 1.0.0
(y <- fixed(year = 2000, month = 02, day = 29, calendar = CE()))
as_date(y, calendar = CE())
as_year(y, calendar = CE())

## Create a vector of years BP (Gregorian)
## (every two years starting from 2000 BP)
(years <- seq(from = 2000, by = -2, length.out = 10))
## Convert years to rata die
(rd <- fixed(years, calendar = BP()))
## Convert back to Gregorian years BP
as_year(rd, calendar = BP())

## More convenient
(rd <- fixed_from_BP(years))
fixed_to_BP(rd)
```

`as_decimal`

Converts a Date to a Decimal of its Year

Description

Converts a Date to a Decimal of its Year

Usage

```
as_decimal(year, month, day, calendar)

## S4 method for signature 'numeric,numeric,numeric,GregorianCalendar'
as_decimal(year, month, day, calendar)

## S4 method for signature 'numeric,numeric,numeric,JulianCalendar'
as_decimal(year, month, day, calendar)
```

Arguments

year	A <code>numeric</code> vector of years. If month and day are missing, decimal years are expected.
month	A <code>numeric</code> vector of months.
day	A <code>numeric</code> vector of days.
calendar	A <code>TimeScale</code> object specifying the calendar of year, month and day (see <code>calendar()</code>).

Value

A `numeric` vector of (ecimal years.

calendar

Calendar

Description

Calendar

Usage

```
calendar(object)

## S4 method for signature 'character'
calendar(object)
```

Arguments

object A **character** string specifying the abbreviated label of the time scale (see details) or an object from which to extract the time scale.

Details

The following time scales are available:

label	era	calendar
BP	Before Present	Gregorian
BC	Before Christ	Gregorian
BCE	Before Common Era	Gregorian
AD	Anno Domini	Gregorian
CE	Common Era	Gregorian
b2k	Years before 2000	Gregorian

julian	Julian
--------	--------

Value

A [TimeScale](#) object.

Note

Inspired by [era::era\(\)](#) by Joe Roe.

Author(s)

N. Frerebeau

See Also

Other calendar tools: [calendar_get](#), [convert\(\)](#), [gregorian](#), [is\(\)](#), [julian\(\)](#)

Examples

```
## Define time scales
calendar("BP")
calendar("AD")
calendar("julian")

## Shortcuts
BP()
AD()
J()
```

calendar_get	<i>Calendar Parameters</i>
--------------	----------------------------

Description

Calendar Parameters

Usage

```
calendar_label(object)
calendar_name(object)
calendar_unit(object)
calendar_epoch(object)
calendar_fixed(object)
```

```

calendar_direction(object)

calendar_year(object)

## S4 method for signature 'TimeScale'
calendar_label(object)

## S4 method for signature 'TimeScale'
calendar_name(object)

## S4 method for signature 'TimeScale'
calendar_unit(object)

## S4 method for signature 'TimeScale'
calendar_epoch(object)

## S4 method for signature 'TimeScale'
calendar_fixed(object)

## S4 method for signature 'TimeScale'
calendar_direction(object)

## S4 method for signature 'NULL'
calendar_direction(object)

## S4 method for signature 'TimeScale'
calendar_year(object)

```

Arguments

`object` A [TimeScale](#) object.

Value

- `calendar_label()` returns a [character](#) string giving the abbreviated label of the time scale.
- `calendar_name()` returns a [character](#) string giving the name of the time scale.
- `calendar_unit()` returns a [character](#) string giving the unit of the calendar.
- `calendar_fixed()` returns a length-one [numeric](#) vector giving the reference date of the calendar (*in rata die*).
- `calendar_epoch()` returns a length-one [numeric](#) vector giving the epoch year from which years are counted (starting date of the calendar, in years).
- `calendar_direction()` returns a length-one [integer](#) vector specifying if years are counted backwards (-1) or forwards (1) from epoch. Only the [sign](#) of `calendar_direction()` is relevant.
- `calendar_year()` returns a length-one [numeric](#) vector giving the average length of the year in solar days.

calendar("julian")

## Shortcuts
BP()
AD()
J()
```

convert

Calendar Converter

Description

Interconverts dates in a variety of calendars.

Usage

```
convert(from, to, ...)

## S4 method for signature 'character,character'
convert(from, to)

## S4 method for signature 'TimeScale,TimeScale'
convert(from, to)
```

Arguments

- | | |
|-------------------|--|
| <code>from</code> | A TimeScale object describing the source calendar. |
| <code>to</code> | A TimeScale object describing the target calendar. |
| <code>...</code> | Currently not used. |

Value

A [function](#) that when called with a single numeric argument (fractional years) converts years from one calendar to another.

Author(s)

N. Frerebeau

See Also

Other calendar tools: [calendar\(\)](#), [calendar_get](#), [gregorian](#), [is\(\)](#), [julian\(\)](#)

Examples

```
## Define time scales
BP <- calendar("BP")
AD <- calendar("AD")

## Make conversion functions
BP_to_AD <- convert(BP, AD)
AD_to_BP <- convert(AD, BP)

## Convert years
BP_to_AD(0)
AD_to_BP(1950)
```

dates

Sample Data from Reingold and Dershowitz (2018)

Description

A dataset of 33 dates from the years -1000 to 2100 with their equivalents on different calendars.

Usage

dates

Format

A [data.frame](#) with 33 rows and 14 variables:

```
rata_die Rata die.
weekday Week day.
jd Julian day.
mjd Modified Julian day.
unix Unix.
gregorian_year, gregorian_month, gregorian_day Gregorian date.
julian_year, julian_month, julian_day Julian date.
egyptian_year, egyptian_month, egyptian_day Egyptian date.
```

References

Reingold, E. M. and Dershowitz, N. (2018). *Calendrical Calculations: The Ultimate Edition*. Cambridge University Press. doi:[10.1017/9781107415058](https://doi.org/10.1017/9781107415058).

fixed	Rata Die (<i>Fixed Date</i>)
-------	--------------------------------

Description

Rata Die (Fixed Date)

Usage

```
fixed(year, month, day, calendar, ...)

## S4 method for signature 'numeric,missing,missing,GregorianCalendar'
fixed(year, calendar, scale = 1)

## S4 method for signature 'numeric,numeric,numeric,GregorianCalendar'
fixed(year, month, day, calendar)

## S4 method for signature 'numeric,missing,missing,JulianCalendar'
fixed(year, calendar, scale = 1)

## S4 method for signature 'numeric,numeric,numeric,JulianCalendar'
fixed(year, month, day, calendar)
```

Arguments

year	A <code>numeric</code> vector of years. If month and day are missing, decimal years are expected.
month	A <code>numeric</code> vector of months.
day	A <code>numeric</code> vector of days.
calendar	A <code>TimeScale</code> object specifying the calendar of year, month and day (see <code>calendar()</code>).
...	Currently not used.
scale	A length-one <code>integer</code> vector specifying the number of years represented by one unit. It should be a power of 10 (i.e. 1000 means ka).

Details

Rata die are represented as the number of days since 01-01-01 (Gregorian), with negative values for earlier dates.

Value

A `RataDie` object.

Author(s)

N. Frerebeau

References

Reingold, E. M. and Dershowitz, N. (2018). *Calendrical Calculations: The Ultimate Edition*. Cambridge University Press. doi:[10.1017/9781107415058](https://doi.org/10.1017/9781107415058).

## Convert back to Gregorian years BP
as_year(rd, calendar = BP())

## More convenient
(rd <- fixed_from_BP(years))
fixed_to_BP(rd)
```

`fixed_gregorian`

Rata Die *Conversion to and from Gregorian Years*

Description

Convenient functions for conversion from and to *rata die* for a given Gregorian era.

Usage

```
fixed_from_BP(year, month, day)

fixed_to_BP(object)

fixed_from_BC(year, month, day)

fixed_to_BC(object)
```

```
fixed_from_BCE(year, month, day)  
fixed_to_BCE(object)  
fixed_from_AD(year, month, day)  
fixed_to_AD(object)  
fixed_from_CE(year, month, day)  
fixed_to_CE(object)  
fixed_from_b2k(year, month, day)  
fixed_to_b2k(object)
```

Arguments

year	A numeric vector of years. If month and day are missing, decimal years are expected.
month	A numeric vector of months.
day	A numeric vector of days.
object	A RataDie object (see fixed()).

Details

The astronomical notation is used for Gregorian years (there *is* a year 0).

Value

- `fixed_from_*`() returns a [RataDie](#) object.
- `fixed_to_*`() returns a [numeric](#) vector of Gregorian years.

## Convert back to Gregorian years BP
as_year(rd, calendar = BP())

## More convenient
(rd <- fixed_from_BP(years))
fixed_to_BP(rd)
```

`fixed_julian`

Rata Die *Conversion to and from Julian Years*

Description

Convenient functions for conversion from and to *rata die*.

Usage

```
fixed_from_julian(year, month, day)

fixed_to_julian(object)
```

Arguments

<code>year</code>	A <code>numeric</code> vector of years. If <code>month</code> and <code>day</code> are missing, decimal years are expected.
<code>month</code>	A <code>numeric</code> vector of months.
<code>day</code>	A <code>numeric</code> vector of days.
<code>object</code>	A <code>RataDie</code> object (see <code>fixed()</code>).

Value

- `fixed_from_julian()` returns a `RataDie` object.
- `fixed_to_julian()` returns a `numeric` vector of Julian years.

Author(s)

N. Frerebeau

References

## Create a vector of years BP (Gregorian)
## (every two years starting from 2000 BP)
(years <- seq(from = 2000, by = -2, length.out = 10))
## Convert years to rata die
(rd <- fixed(years, calendar = BP()))
## Convert back to Gregorian years BP
as_year(rd, calendar = BP())

## More convenient
(rd <- fixed_from_BP(years))
fixed_to_BP(rd)
```

format

Date Conversion to Character

Description

Date Conversion to Character

Usage

```
## S4 method for signature 'TimeScale'
format(x, ...)

## S4 method for signature 'RataDie'
format(
  x,
  prefix = c("a", "ka", "Ma", "Ga"),
  label = TRUE,
  calendar = getOption("aion.calendar"),
  ...
)
```

Arguments

x	A RataDie object.
...	Currently not used.
prefix	A character string specifying the prefix. It should be one of "a", "ka", "Ma" or "Ga". If TRUE, a good guess for an appropriate format is made.
label	A logical scalar: should the label of the calendar be displayed?
calendar	A TimeScale object specifying the target calendar (see calendar()).

Value

A [character](#) vector representing the date.

*image**Heat Map*

Description

Heat Map

Usage

```
## S4 method for signature 'TimeSeries'
image(x, calendar = getOption("aion.calendar"), k = 1, ...)
```

Arguments

x	A TimeSeries object.
calendar	A TimeScale object specifying the target calendar (see calendar()).
k	An integer specifying the slice of x along the third dimension to be plotted.
...	Further parameters to be passed to graphics::image() .

Value

`image()` is called for its side-effects: it results in a graphic being displayed. Invisibly returns `x`.

Examples

```
## Create 6 time-series of 50 observations
## Sampled every two years starting from 2000 BP
X <- series(
  object = matrix(rnorm(300), nrow = 50, ncol = 6),
  time = seq(2000, by = -2, length.out = 50),
  calendar = BP()
)

## Image
image(X, calendar = CE())
```

<code>intervals</code>	<i>Create Time Intervals</i>
------------------------	------------------------------

Description

An Interval is elapsed time in seconds between two specific years.

Usage

```
intervals(start, end, calendar, ...)

## S4 method for signature 'RataDie,RataDie,missing'
intervals(start, end, names = NULL)

## S4 method for signature 'numeric,numeric,TimeScale'
intervals(start, end, calendar, scale = 1, names = NULL)
```

Arguments

<code>start</code>	A <code>numeric</code> vector of (decimal) years or a <code>RataDie</code> object (see <code>fixed()</code>) giving the beginning of the time intervals.
<code>end</code>	A <code>numeric</code> vector of (decimal) years or a <code>RataDie</code> object (see <code>fixed()</code>) giving the end of the time intervals.
<code>calendar</code>	A <code>TimeScale</code> object specifying the calendar of <code>time</code> (see <code>calendar()</code>). If missing, <code>time</code> must be a <code>RataDie</code> object.
<code>...</code>	Currently not used.
<code>names</code>	A <code>character</code> string specifying the names of the time series.
<code>scale</code>	A length-one <code>numeric</code> vector specifying the number of years represented by one unit. It should be a power of 10 (i.e. 1000 means ka).

Value

A `TimeIntervals` object.

Author(s)

N. Frerebeau

Examples

```
## Create time intervals
int <- intervals(
  start = c(625, 700, 1200, 1225, 1250, 500, 1000, 1200,
           1325, 1375, 1200, 1300, 1375, 1275, 1325),
  end = c(750, 825, 1250, 1275, 1325, 700, 1300, 1325,
         1400, 1500, 1300, 1375, 1500, 1325, 1425),
  calendar = CE())
```

```
)
## Plot intervals
plot(int) # Default calendar

## Overlap
overlap(int, calendar = CE())
```

is *Is an Object a Calendar?*

Description

Test inheritance relationships between an object and a calendar class.

Usage

```
is_gregorian(object)

is_julian(object)

## S4 method for signature 'ANY'

N. Frerebeau

See Also

Other mutators: [as.data.frame\(\)](#), [length\(\)](#), [subset\(\)](#)

length	<i>Length</i>
--------	---------------

Description

Get the length of an object.

Usage

```
## S4 method for signature 'TimeIntervals'
length(x)
```

Arguments

x	An R object.
---	--------------

Value

A length-one `integer` vector.

Author(s)

N. Frerebeau

See Also

Other mutators: `as.data.frame()`, `labels()`, `subset()`

overlap

Time Overlap

Description

Computes the length of overlap of time intervals.

Usage

```
overlap(x, ...)

## S4 method for signature 'TimeIntervals'
overlap(x, calendar = NULL)
```

Arguments

x	A <code>TimeIntervals</code> object.
...	Currently not used.
calendar	A <code>TimeScale</code> object specifying the target calendar (see <code>calendar()</code>). If <code>NULL</code> (the default), <i>rata die</i> are returned.

Details

The overlap of two time intervals is a difference between the minimum value of the two upper boundaries and the maximum value of the two lower boundaries, plus 1.

Value

A symmetric numeric `matrix` of years.

Author(s)

N. Frerebeau

Plot Time Series and Time Intervals

Description

Plot Time Series and Time Intervals

Usage

```
## S4 method for signature 'TimeIntervals,missing'
plot(
  x,
  calendar = getOption("aion.calendar"),
  sort = TRUE,
  decreasing = FALSE,
  xlab = NULL,
  ylab = NULL,
  main = NULL,
  sub = NULL,
  ann = graphics:::par("ann"),
  axes = TRUE,
  frame.plot = axes,
  panel.first = NULL,
  panel.last = NULL,
  ...
)

## S4 method for signature 'TimeSeries,missing'
plot(
  x,
  facet = c("multiple", "single"),
  calendar = getOption("aion.calendar"),
```

```

panel = graphics::lines,
flip = FALSE,
ncol = NULL,
xlab = NULL,
ylab = NULL,
main = NULL,
sub = NULL,
ann = graphics::par("ann"),
axes = TRUE,
frame.plot = axes,
panel.first = NULL,
panel.last = NULL,
...
)

```

Arguments

<code>x</code>	A <code>TimeSeries</code> or a <code>TimeIntervals</code> object.
<code>calendar</code>	A <code>TimeScale</code> object specifying the target calendar (see <code>calendar()</code>).
<code>sort</code>	A <code>logical</code> scalar: should the data be sorted in chronological order?
<code>decreasing</code>	A <code>logical</code> scalar: should the sort order be decreasing? Only used if <code>sort</code> is <code>TRUE</code> .
<code>xlab, ylab</code>	A <code>character</code> vector giving the x and y axis labels.
<code>main</code>	A <code>character</code> string giving a main title for the plot.
<code>sub</code>	A <code>character</code> string giving a subtitle for the plot.
<code>ann</code>	A <code>logical</code> scalar: should the default annotation (title and x and y axis labels) appear on the plot?
<code>axes</code>	A <code>logical</code> scalar: should axes be drawn on the plot?
<code>frame.plot</code>	A <code>logical</code> scalar: should a box be drawn around the plot?
<code>panel.first</code>	An expression to be evaluated after the plot axes are set up but before any plotting takes place. This can be useful for drawing background grids.
<code>panel.last</code>	An expression to be evaluated after plotting has taken place but before the axes, title and box are added.
<code>...</code>	Further parameters to be passed to <code>panel</code> (e.g. graphical parameters).
<code>facet</code>	A <code>character</code> string specifying whether the series should be plotted separately (with a common time axis) or on a single plot? It must be one of "multiple" or "single". Any unambiguous substring can be given.
<code>panel</code>	A <code>function</code> in the form <code>function(x, y, ...)</code> which gives the action to be carried out in each panel of the display. The default is <code>graphics::lines()</code> .
<code>flip</code>	A <code>logical</code> scalar: should the y-axis (ticks and numbering) be flipped from side 2 (left) to 4 (right) from series to series when <code>facet</code> is "multiple"?
<code>ncol</code>	An <code>integer</code> specifying the number of columns to use when <code>facet</code> is "multiple". Defaults to 1 for up to 4 series, otherwise to 2.

Value

`plot()` is called for its side-effects: it results in a graphic being displayed. Invisibly returns `x`.

Author(s)

N. Frerebeau

plot(X, type = "p", pch = c(16, 17, 18), cex = c(1, 2, 3))
```

pretty

Pretty Breakpoints

Description

Pretty Breakpoints

Usage

```
## S4 method for signature 'RataDie'  
pretty(x, calendar = getOption("aion.calendar"), ...)
```

Arguments

- | | |
|----------|--|
| x | A RataDie object. |
| calendar | A TimeScale object specifying the target calendar (see calendar()). |
| ... | Further parameters to be passed to base::pretty() . |

Details

`pretty()` computes a vector of increasing numbers which are "pretty" in decimal notation of calendar. Pretty breakpoints are then converted to *rata die*.

Value

A [RataDie](#) object.

See Also

Other fixed date tools: [arithmetic](#), [as_date\(\)](#), [as_decimal\(\)](#), [as_fixed\(\)](#), [as_year\(\)](#), [fixed\(\)](#), [fixed_gregorian](#), [fixed_julian](#), [format\(\)](#)

RataDie-class

RataDie

Description

An S4 class to represent a vector of *rata die*.

Details

Rata die (fixed date) are represented as the number of days since 01-01-01 (Gregorian), with negative values for earlier dates.

It is intended that the date should be an integer value, but this is not enforced in the internal representation.

Slots

.Data A [numeric](#) vector giving the *rata die* values.

Note

This class inherits from [numeric](#).

Create Time Series

Description

Create Time Series

Usage

```
series(object, time, calendar, ...)

## S4 method for signature 'array,RataDie,missing'
series(object, time, names = NULL)

## S4 method for signature 'array,numeric,TimeScale'
series(object, time, calendar, scale = 1, names = NULL)

## S4 method for signature 'matrix,numeric,TimeScale'
series(object, time, calendar, scale = 1, names = NULL)

## S4 method for signature 'matrix,RataDie,missing'
series(object, time, names = NULL)

## S4 method for signature 'numeric,numeric,TimeScale'
series(object, time, calendar, scale = 1, names = NULL)

## S4 method for signature 'numeric,RataDie,missing'
series(object, time, names = NULL)

## S4 method for signature 'data.frame,numeric,TimeScale'
```

```
series(object, time, calendar, scale = 1, names = NULL)

## S4 method for signature 'data.frame,RataDie,missing'
series(object, time, names = NULL)
```

Arguments

object	A <code>numeric</code> vector, matrix or array of the observed time-series values. A <code>data.frame</code> will be coerced to a numeric matrix via <code>data.matrix()</code> .
time	A <code>numeric</code> vector of (decimal) years or a <code>RataDie</code> object (see <code>fixed()</code>).
calendar	A <code>TimeScale</code> object specifying the calendar of time (see <code>calendar()</code>). If missing, time must be a <code>RataDie</code> object.
...	Currently not used.
names	A <code>character</code> string specifying the names of the time series.
scale	A length-one <code>numeric</code> vector specifying the number of years represented by one unit. It should be a power of 10 (i.e. 1000 means ka).

Details

Data will be sorted in chronological order.

Value

A `TimeSeries` object.

Author(s)

N. Frerebeau

Examples

```
## Create time-series of 20 observations

## Univariate
## Sampled every years starting from 1029 BCE
(X <- series(rnorm(30), time = 1029:1000, calendar = BCE()))

## Terminal and sampling times (returns rata die)
start(X)
end(X)
time(X)
span(X)

## Multivariate
## Sampled every century starting from 1000 CE
(Y <- series(matrix(rnorm(90), 30, 3), time = 1000:1029, calendar = CE()))

## Terminal and sampling times (returns Gregorian Common Era years)
start(Y, calendar = CE())
end(Y, calendar = CE())
```

```
time(Y, calendar = CE())
span(Y, calendar = CE())

## Coerce to data frame
df <- as.data.frame(Y, calendar = BP())
head(df)
```

span

*Duration***Description**

Get the duration of time series or intervals.

Usage

```
span(x, ...)

## S4 method for signature 'TimeSeries'
span(x, calendar = NULL)

## S4 method for signature 'TimeIntervals'
span(x, calendar = NULL)
```

Arguments

x	A TimeSeries or a TimeIntervals object.
...	Currently not used.
calendar	A TimeScale object specifying the target calendar (see calendar()). If NULL (the default), <i>rata die</i> are returned.

Value

A [numeric](#) vector of years.

  calendar = CE()
)

## Get time durations
span(int, calendar = CE())
```

start

Terminal Times

Description

Get the times the first and last observations were taken.

Usage

```
## S4 method for signature 'TimeSeries'
start(x, calendar = NULL, ...)

## S4 method for signature 'TimeIntervals'
start(x, calendar = NULL, ...)

## S4 method for signature 'TimeSeries'
end(x, calendar = NULL, ...)

## S4 method for signature 'TimeIntervals'
end(x, calendar = NULL, ...)
```

Arguments

- x A `TimeSeries` object.
- calendar A `TimeScale` object specifying the target calendar (see `calendar()`). If `NULL` (the default), *rata die* are returned.
- ... Currently not used.

Value

A `numeric` vector of decimal years (if `calendar` is not `NULL`).

span(Y, calendar = CE())

## Coerce to data frame
df <- as.data.frame(Y, calendar = BP())
head(df)
```

subset

*Extract or Replace Parts of an Object***Description**

Operators acting on objects to extract or replace parts.

Usage

```
## S4 method for signature 'RataDie'
x[i]

## S4 method for signature 'TimeIntervals'
x[i]

## S4 method for signature 'TimeSeries'
x[i, j, k, drop = FALSE]
```

Arguments

x	An object from which to extract element(s) or in which to replace element(s).
i, j, k	Indices specifying elements to extract or replace.
drop	A logical scalar: should the result be coerced to the lowest possible dimension? This only works for extracting elements, not for the replacement.

Value

A subsetted object.

Author(s)

N. Frerebeau

See Also

Other mutators: [as.data.frame\(\)](#), [labels\(\)](#), [length\(\)](#)

time

Sampling Times

Description

Get the sampling times:

- `time()` creates the vector of times at which a time series was sampled.
- `frequency()` returns the mean number of samples per unit time.

Usage

```
## S4 method for signature 'TimeSeries'
time(x, calendar = NULL, ...)

## S4 method for signature 'TimeSeries'
frequency(x, ...)
```

Arguments

x	A TimeSeries object.
calendar	A TimeScale object specifying the target calendar (see calendar()). If NULL (the default), <i>rata die</i> are returned.
...	Currently not used.

Value

A [numeric](#) vector of decimal years (if `calendar` is not NULL).

head(df)
```

TimeIntervals-class *TimeIntervals*

Description

An S4 class to represent time intervals.

Slots

- .Id A [character](#) vector specifying the identifier/name of intervals. Duplicated values are interpreted as disjoint intervals referring to the same event.
- .Start A [RataDie](#) object giving the start time of the intervals.
- .End A [RataDie](#) object giving the end time of the intervals.

Author(s)

N. Frerebeau

See Also

Other classes: [GregorianCalendar-class](#), [JulianCalendar-class](#), [RataDie-class](#), [TimeScale-class](#), [TimeSeries-class](#)

Other time classes: [RataDie-class](#), [TimeSeries-class](#)

TimeScale-class

TimeScale

Description

A virtual S4 class to represent a calendar.

Slots

label A [character](#) string specifying the abbreviated label of the time scale.

name A [character](#) string specifying the name of the time scale.

epoch A [numeric](#) value specifying the epoch year from which years are counted (starting date of the calendar, in years). Allows to define multiple era of a calendar.

fixed A [numeric](#) value specifying the reference date of the calendar (in *rata die*).

direction An [integer](#) specifying if years are counted backwards (-1) or forwards (1) from epoch.

year A [numeric](#) value giving the average length of the year in solar days.

Author(s)

N. Frerebeau

TimeSeries-class *TimeSeries*

Description

An S4 class to represent time series.

Details

A time series object is an $n \times m \times p$ array, with n being the number of observations, m being the number of series and with the p columns of the third dimension containing extra variables for each series.

Slots

- .Data A $n \times m \times p$ numeric [array](#) giving the observed time-series values.
- .Time A length- n [RataDie](#) object.

Note

This class inherits from [array](#).

Author(s)

N. Frerebeau

See Also

Other classes: [GregorianCalendar-class](#), [JulianCalendar-class](#), [RataDie-class](#), [TimeIntervals-class](#), [TimeScale-class](#)

Other time classes: [RataDie-class](#), [TimeIntervals-class](#)

window *Time Windows*

Description

Extracts the subset of the object x observed between the times $start$ and end (expressed in *rata die*).

Usage

```
## S4 method for signature 'TimeSeries'
window(x, start = NULL, end = NULL, ...)
```

Arguments

x	A <code>TimeSeries</code> object.
start	A length-one <code>numeric</code> vector specifying the start time of the period of interest.
end	A length-one <code>numeric</code> vector specifying the end time of the period of interest.
...	Currently not used.

Value

A `TimeSeries` object.

Author(s)

N. Frerebeau

See Also

Other tools: `overlap()`, `span()`, `start()`, `time()`

Examples

```
## Create 3 time-series of 100 observations
## Sampled every years starting from 1000 CE
(x <- series(matrix(rnorm(300), 100, 3), time = 1000:1099, calendar = CE()))

## Subset between 1025 and 1050 CE
(y <- window(x, start = 374009, end = 383140))
```

Description

Time Series Plotting Functions

Usage

```
year_axis(
  side,
  at = NULL,
  format = c("a", "ka", "Ma", "Ga"),
  labels = TRUE,
  calendar = getOption("aion.last_calendar"),
  current_calendar = getOption("aion.last_calendar"),
  ...
)
```

Arguments

side	An <code>integer</code> specifying which side of the plot the axis is to be drawn on. The axis is placed as follows: 1=below, 2=left, 3=above and 4=right.
at	A <code>numeric</code> vector giving the points at which tick-marks are to be drawn. If <code>NULL</code> , tickmark locations are computed.
format	A <code>character</code> string specifying the prefix. It should be one of "a", "ka", "Ma" or "Ga". If <code>TRUE</code> , a good guess for an appropriate format is made.
labels	A <code>logical</code> scalar specifying whether annotations are to be made at the tickmarks, or a vector of <code>character</code> strings to be placed at the tickpoints.
calendar	A <code>TimeScale</code> object specifying the target calendar (see <code>calendar()</code>).
current_calendar	A <code>TimeScale</code> object specifying the calendar used by the last call to <code>plot()</code> .
...	Further parameters to be passed to <code>graphics::axis()</code> . (e.g. <code>graphical parameters</code>).

Value

`year_axis()` is called it for its side-effects.

Author(s)

N. Frerebeau
